1 Crafting a Compiler

1.1 Exercise 9.2

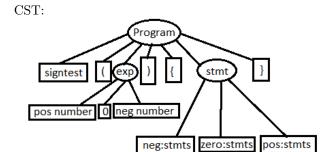

Assume that we add a new kind of conditional statement to C or Java, the signtest. Its structure is:

```
signtest ( exp ) {
  neg: stmts
  zero: stmts
  pos: stmts
}
```

The integer expression exp is evaluated. If it is negative, the statements following neg are executed. If it is zero, the statements following zero are executed. If it is positive, the statements following pos are executed. Show the AST you would use for this construct. Revise the semantic analysis, reachability, and throws visitors for if statements (Section 9.1.2) to handle the signtest.

Left Most Derivation:

```
 \begin{array}{l} <\!\operatorname{program}> \to \operatorname{signtest} \ (\ <\!\operatorname{exp}> \ ) \ \{\ <\!\operatorname{stmt}>\} \\ <\!\operatorname{exp}> \longrightarrow \operatorname{neg\ number} \\ \to \operatorname{pos\ number} \\ \to \operatorname{zero} \\ <\!\operatorname{stmt}> \to \operatorname{neg\ :\ stmts} \\ \to \operatorname{pos\ :\ stmts} \\ \to \operatorname{pos\ :\ stmts} \\ \end{array}
```

AST: Signtest Statements

```
Semantic analysis:
```

```
void checkInt(int c) { boolean hasError = false; if (c.type != int) { System.out.println("Error: expression " + c + " is not an int at " + c.lineNum); hasError = true; } } }
```

Reachability analysis:

```
\label{eq:continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous
```

Throw Visitors:

void throwVisitor(signtestNode n){

gather Throws(n); /*This method is detailed in the text and is used for all keywords. The only change required is to change the input to a Sign test. */
